

Implementation

NetworkX
Network Analysis in Python

Implementation

Details

- Library functions have been used whenever possible.
- A new custom class has been defined in order to deal with the custom weight function used in Algorithm WD. This new class inherits from `tuple` and implements addition and comparison as described in the paper.
- Time complexity has been assessed with the library `big_o`, which just measures the running time for different values of n and then fits a set of different time complexity classes, in order to find the best one.
- Space complexity has been assessed analytically, due the absence of a Python library able to perform an empirical analysis.
